ROLE A · SALES SUMMARY

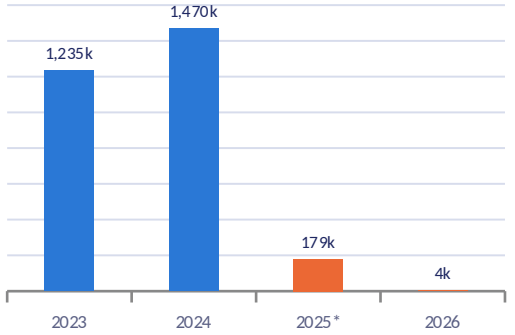

Sales trends & category revenue

Reio · Monthly trend, category comparison, and a 2025+ data-quality flag

2024 Monthly Revenue (€)

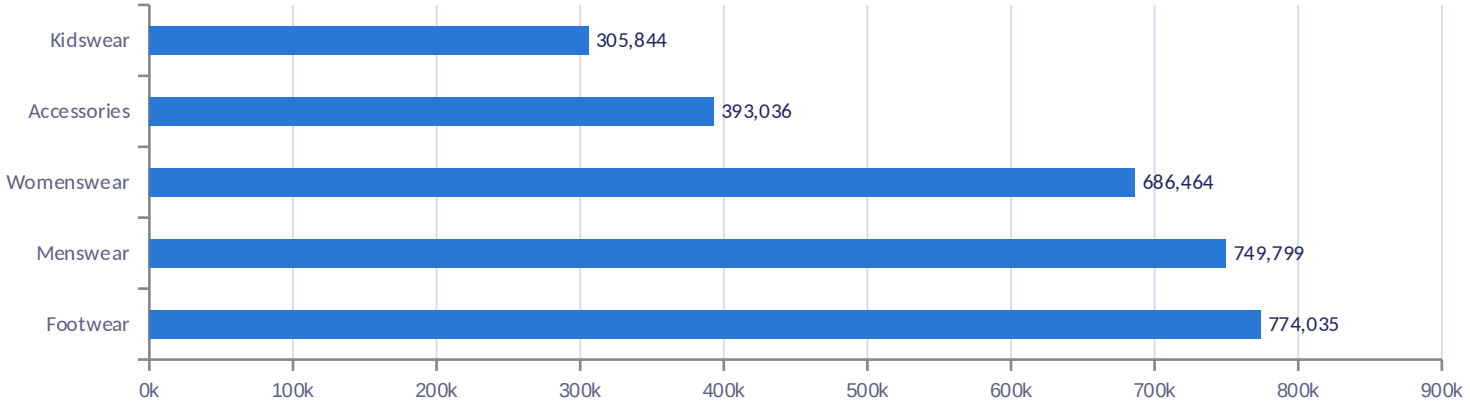

Revenue by Year (€)

**2025 is a partial sum (kidswear not captured in the year breakdown) — real total is somewhat higher, but the drop from 2024 holds either way.*

All-Time Revenue by Category (€)

RECOMMENDATION

Lead the board update with December's close (+54.3% on November, €170,623.28 peak) and the footwear/menswear €700K+ lead. Treat accessories/kidswear as a pricing opportunity, not underperformance — their unit sales are comparable to every other category.

BIGGEST SURPRISE

Revenue ranking mostly reflects price tier, not demand. Kidswear sold nearly as many units as footwear (3,677 vs 3,726) but earns less than half the revenue, since its average price (€84.70) is ~40% of footwear's (€213.26).

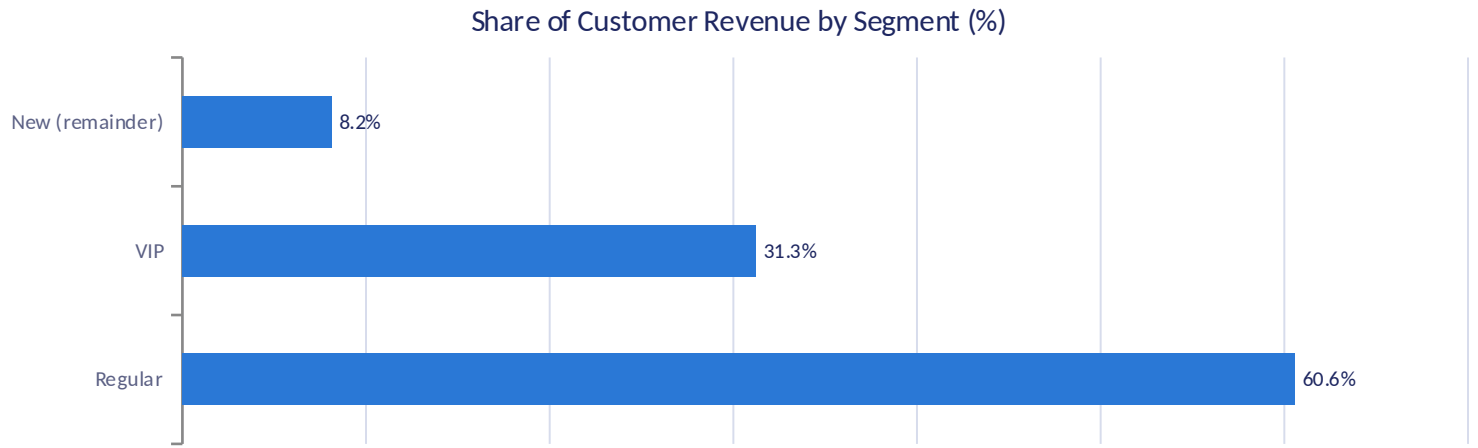

DATA NOTE

Revenue and order volume both collapse after 2024 (see year chart) — a ~87% drop hits every category at nearly the same rate. Too uniform to be a real business event; likely a data-completeness gap. Don't report 2025+ figures without confirming with Anna first.

ROLE B · CUSTOMER SEGMENTATION

VIP, Regular & New customer value

Grouping customers by total spend to find who UrbanStyle should prioritise

VIP customers are a small group with outsized value

~8%

of all customers

31.25%

of total revenue

City insight (qualitative — no exact figures provided): Tallinn has the largest VIP customer base, but Pärnu and Jõhvi show higher average VIP spending per customer. High-value customers aren't concentrated only in the biggest market.

RECOMMENDATION

Don't treat every segment or city the same. Protect and retain high-value VIP customers (only ~8% of customers, 31.25% of revenue), while building a clear path to convert New customers into Regular ones.

BIGGEST SURPRISE

City-level VIP spending doesn't track city size — Pärnu and Jõhvi punch above their weight on average VIP spend, despite Tallinn having the largest VIP headcount overall.

DATA NOTE

Exact customer counts and average spend by segment-and-city weren't included in what was shared with the team — the city comparison here is a ranking, not backed by precise figures in this deck.

ROLE C · INVENTORY STATISTICS

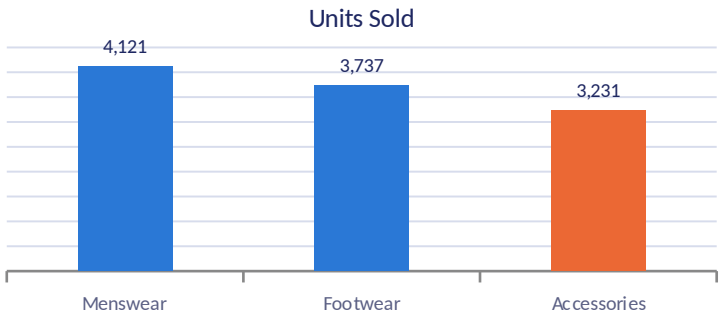

Category volume, price & stock movement

Category performance and slow-moving stock

Category	Status	Units sold	Avg price	Note
Menswear (meeste_riided)	Best volume	4,121	€188.61*	Top seller by units overall
Footwear (jalanõusid)	Best price, strong volume	3,737	€214.10	Sold well even at prices up to €434.08
Accessories (aksessuaarid)	Needs work — least sold	3,231	€122.88	€231.13 leather mittens sitting unmoved

**Menswear and accessories avg price pulled from Reio's Task Card A category query — Daria's list didn't include them. Menswear's unit count there is 4,112 vs 4,121 above, a small gap in line with Daria's reconciliation note.*

Category comparison — units sold & average price

RECOMMENDATION

Shift inventory budget away from slow-moving accessories toward footwear and menswear. Discount cheap, stagnant accessories (€13.53–€25.00 items) to clear stock.

BIGGEST SURPRISE

Footwear sold exceptionally well despite high prices — customers bought 3,737 units even with individual items priced up to €434.08.

MISSING DATA

No marketing-cost, current stock-count, or customer-feedback data available — can't calculate true ROI or confirm real-time restocking needs from this dataset alone.

ROLE D · MARKETING CAMPAIGN ROI

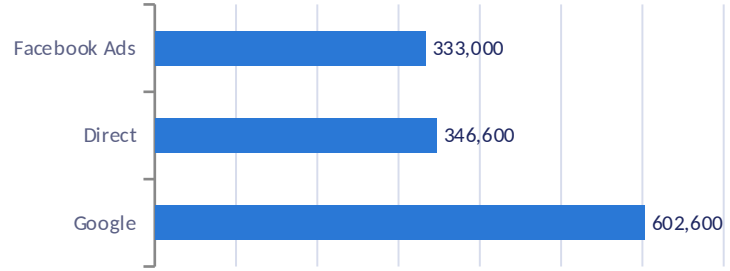

Channel effectiveness via last-touch attribution

Daria · Web-log sources normalised, then attributed to sales by last session before purchase

Reconciles fully with sales: 10,118 orders / €2,909,177.98 revenue, before and after attribution — nothing duplicated or lost.

Note from Daria: this analysis was built primarily with AI assistance; some figures haven't fully reconciled yet (flagged by the mentor) and are pending verification before being treated as final.

Top Attributed Channels (€)

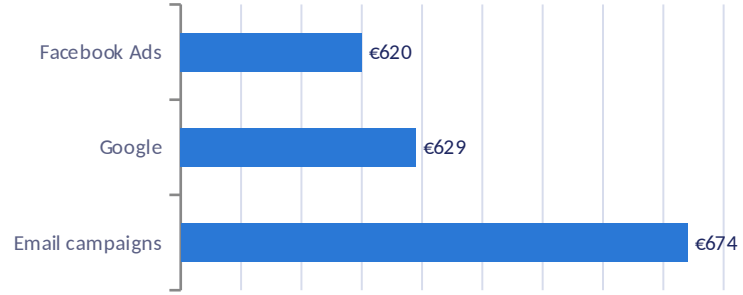

Attributed vs. unattributed revenue

69.3%
attributed
€2.02M

30.7%
unattributed
€893.8K

AOV is similar (~€275–293) across channels — revenue gaps come from order volume, not order size.

Revenue per customer (channels with >100 orders)

December 2024 uplift (cause not established by the data)

Channel	Dec 2024 revenue	MoM change
Facebook Ads	€33.1K	+100.0%
Instagram	€24.6K	+149.9%
Email campaigns	€19.7K	+100.5%

RECOMMENDATION

Google delivers the largest attributed revenue and customer base; email has the strongest revenue per customer (€674). Investigate both further — especially campaign costs and conversion rates — before reallocating budget.

BIGGEST SURPRISE

December 2024 shows a broad uplift across channels at once — Facebook Ads, Instagram, and email all roughly doubled month-over-month. A real seasonal pattern the data can show but not explain.

DATA LIMITATION

No direct sale-to-session link exists, so channel revenue depends on the attribution model chosen, not proven causally. No marketing-cost data either — this measures effectiveness, not true ROI. 30.7% of revenue is unattributed.
